

WARREN COUNTY PUBLIC WATER SYSTEM LEAD SERVICE LINE INVENTORY

In December of 2021, the United States Environmental Protection Agency finalized the Lead and Copper Rule Revisions which mandated all Public Water Systems to complete an inventory of all public and private water service lines and determine where lead service lines are located within their system by October 16, 2024.

Warren County has historically identified the public portion of the service lines to be comprised of the water mains, tapping device, waterline from the main to the meter pit, the meter pit, the water meter, and support devices including angle valves, shut-off valves and corporation stops; and the private side of the service consist of the water service lateral from the outbound side of the meter pit to the home (structure). Also, all of the plumbing inside the home (structure) including water line, solder, fittings, fixtures, and appurtenances are considered private side as well. All private side waterline and appurtenances from the outbound side of the water meter pit are the property of the owner and must be maintained appropriately under that ownership.

The Warren County Water and Sewer Department completed a survey of historical data and has found no evidence of lead service lines within the water system.

When the Warren County Public Water System (previously known as the Franklin-Lebanon Sewer District) was founded in 1960, water service lines were required to be type “K” copper for lines that were 2-inches and smaller and cast iron pipe for service lines larger than 2-inch (Rules and Regulations, December 9, 1960). Over the years, the Rules and Regulations have been updated to allow for plastic and ductile iron service lines in addition to type “K” copper, depending on the size and length of the lines.

Warren County Water & Sewer Department

The Safe Drinking Water Act Amendment of 1986 banned the installation of any new lead service lines and other plumbing in public water systems that provide water for human consumption.

The lead service line inventory does not account for any of the plumbing within the structure itself. Buildings constructed in Ohio prior to 1988 could contain lead pipe and/or lead based solder, buildings constructed prior to 1998, or utilized plumbing materials or solder manufactured before 1998 may contain materials with greater than 8% lead content and are at a higher risk of contributing lead to the drinking water than materials manufactured after 1998. In addition, buildings constructed after 2014 which incorporated plumbing materials manufactured after 2014, which were required to contain less than 0.25% lead by weight, will have the lowest risk for contributing lead to the drinking water.

The complete inventory of the services lines within the Warren County Public Water System is attached and is listed in order of water account number.

Please contact the Warren County Water and Sewer Department should you have any questions or need additional information.
